

Questions to ask...

What do you notice about the 4 hills?

Order the pictures of the hills in order of their *steepness* (most steep to least steep).

How did you decide the order?

Which one is the “odd one out”?

Why?

How can we distinguish its *steepness* from the others?

Would it be useful to assign a value to *steepness*?

Can you think of a way to assign that value?
